

Figure 11. Perspective view of EM-1000 multibeam echo sounder backscatter draped over EM-1000 bathymetry within Cretaceous outcrop region shown on Figure 10. High backscatter is represented by light tones, low backscatter by dark tones. The perspective views were collected within the eastern (top - A) and western (bottom - B) sections of the Cretaceous outcrop region, and show a series of large dunes oriented east-west. The north-facing flanks are blanketed by high-backscatter gravelly sand deposits, while the south-facing flanks are covered with a fine- to medium-grained, moderate-low backscatter sand with elongate high-backscatter "stringers". See Figures 3 and 10 for location.
